4 Intermediate and Complex Puzzles

This is the longest chapter, with 200 puzzles, with hints or other instructions for the first 90. For the remaining 110 you are just given the position and told who is to move, presenting you with the 'real-game' situation of simply deciding what you should play next. Choose carefully, as the result of the game may well be hanging in the balance.

From 221 to 310 the puzzles increase in difficulty from level 1 to level 4. In puzzle 311 (the first without a hint) the level goes back down to level 1 and then begins to rise again, up to puzzle 420.

The e3-knight is lodged in White's camp, but what is protecting it?

Black is short of space, and this can be exploited immediately.

What is the quickest way to finish off the black king?

The black king is boxed in. How can this be used to force checkmate?

How can White take advantage of the dominant position of his queen?

There is one particularly weak square in the white king's position... namely?

The black king is vulnerable to many different mating patterns. How can this best be demonstrated?

What is the quickest way to convert White's great advantage?

Here it is the white king whose position is fatally weak on the light squares. How can Black exploit this?

Black's kingside is weakened and White has two tremendous bishops aimed in that direction. How can White exploit this?
